Project- Paperless Work Order System

內容摘要

What is Work Order? - A work order is a form of task/job request that can be scheduled or assigned to the service department. Such an order may be from a maintenance request or created internally within the organization.
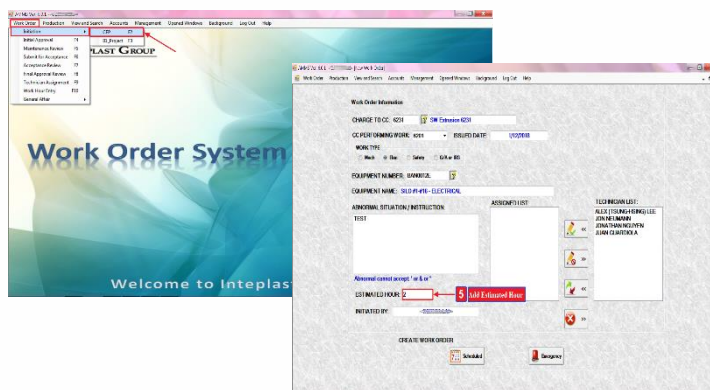

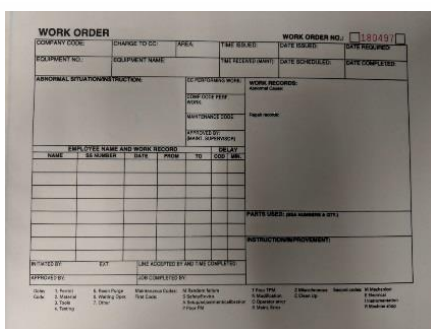

Motivation - Original work order is a paper form that needs to be generated by manually, it is not only waste the human resource but also will increase the company costs (material & labor), and the most important thing is it will not have any data for the future reference.

In order to solve all these problems and keep all the data to the database, we have come out the Paperless work order system.
We create the work order system by utilizing MySQL database, VB language and some development kit for this upgrade project.
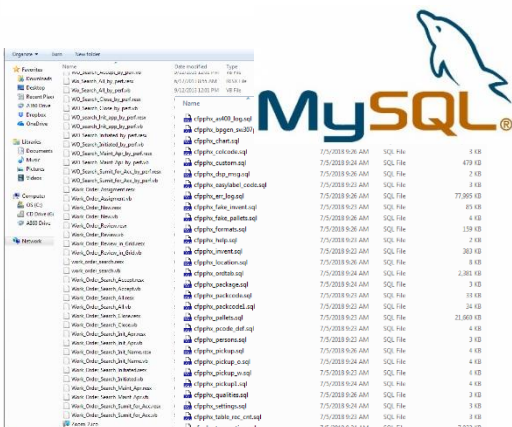

實習成果

Comparison

- Old
  Paper work order

- New
 Paperless work order system

Programing & Database
Whole VB files and SQL files

Setup for end user
Install ODBC and create short cut
